Starting References for Suicide Ideation Study

The article by Cole might be a good place to start. Some of the major variables in the data we will look at are suicide ideation as measured by the 4 items described by Cole, depression as measured by the Beck Depression Inventory (BDI), hopelessness as measured by the Beck Hopelessness Scale, along with a measure of social desirability, some measures of various kinds of childhood abuse, and personality variables (E, N, S, and I).
